

UP FINTECH HOLDING LIMITED

Tiger Brokers: a 30% Grower Priced for Extinction

Equity Research Note · Financials — Capital Markets · October 4, 2026

Recommendation	12-Mo. Price Target	Current Price	Implied Upside	Risk Rating
BUY	\$16.00	\$4.16 Oct 2, 2026 close	+285%	High

The market has priced UP Fintech like a melting ice cube. The numbers say otherwise: record quarterly revenue of \$182.3m (+31% YoY), a return to profitability after a one-off regulatory fine, funded accounts compounding at double digits, a \$7.4b margin book growing 29% a year, and a balance sheet carrying \$545m of cash against negligible debt. At \$4.16 the stock is down 57% year-to-date and 61% in a year, trading at **4.2x normalized earnings** — less than half the multiple of its closest peer Futu, which was fined 4.5x more in the very same regulatory sweep and trades at 11x. The derating is real and partly earned: a \$59.7m CSRC penalty for past unlicensed mainland-China business, compressing take rates, and a China-regulatory narrative that assigns the company a near-zero terminal value. But we see an asymmetric setup: a scaled, profitable, founder-led online broker (1.32m funded accounts, \$60.7b client assets, 81 licenses) valued as if its earnings are about to collapse. Our hardened 10-year scenario DCF (bear \$3.70 / base \$15.73 / bull \$29.26, weighted \$16.11) points to **\$16**; we set the \$16.00 target at the weighted DCF and rate the shares **BUY, High risk**. The bear now sits below the price (\$3.70 vs \$4.16) and prices a genuine –4% revenue-CAGR wind-down with a 50% terminal derating — which is what intellectual honesty demands of the regulatory tail. **The open question that would change the call: a second CSRC action → HOLD.** Size it accordingly.

Market cap	~\$811 m	ADS outstanding	~195 m
52-week range	\$4.00 – \$13.42	1-yr / YTD return	-61% / -57%
Cash + term deposits	\$544.6 m	Debt-to-equity	0.06
TTM GAAP / non-GAAP NI	\$184 m / ~\$190 m	TTM non-GAAP P/E	~4.2x
FY26E revenue (est.)	~\$700 m	Client assets	\$60.7 bn

Prices as of October 2, 2026 close. Financial figures from company releases (Q2 2026 reported Aug 26, 2026; Q1 2026 reported Jun 2, 2026). This note is an independent research-style analysis for informational purposes, not investment advice.

1. Investment thesis

A genuine growth compounder mispriced as a value trap. Revenue compounded ~50% annually from 2023 (\$272.5m) to 2025 (\$613.7m); net income went from \$32.6m to \$171.4m over the same period. H1 2026 revenue of \$337.2m (+29% YoY) and ex-penalty net income of ~\$72m show the engine is intact. The penalty is one-off; the narrative gap is the trade. The May 22, 2026 CSRC fine (\$59.7m) punished past unlicensed mainland-China activity; mainland retail assets are only ~10% of the total and the

company is remediating. Futu absorbed a \$271m fine in the same sweep with no lasting derating. TIGR fell ~60% from its highs on the same category of news.

The profit engine is interest income, not commissions. Margin financing and securities lending (\$7.4b balance, +29% YoY) drove \$79.8m of Q2 interest income (+36% YoY) — ~44% of revenue. Commission take-rate compression (3.6 bps vs 5.9 bps) is a deliberate customer-acquisition subsidy, monetized through the margin book.

Self-clearing is a real structural edge. Over 90% of US cash-equity and option flow is now self-cleared, giving Tiger industry-leading clearing economics — a durable cost moat smaller brokers cannot replicate.

Valuation disconnect is extreme. At 4.2x normalized earnings TIGR is the cheapest broker in its peer set by a wide margin (Futu 11x, Schwab 18x, IBKR 34x, Robinhood 50x). Our hardened 10-year DCF (bear \$3.70 / base \$15.73 / bull \$29.26, weighted \$16.11) and FUTU-parity multiple (\$10.74) both support a well-above-market target.

Catalyst path is visible. Q3 earnings (Dec 2, 2026), formal closure of the CSRC remediation, continued buyback execution (\$45m remaining of \$50m), and any re-rating toward the Futu multiple — which alone is a double from here.

Risks are genuine — hence High risk, not a core holding. Further CSRC action, mainland business wind-down, commission/margin-rate wars, trading-volume cyclicity, and ADR/delisting overhang. Our hardened bear case (\$3.70) now sits below the current price and prices a genuine –4% revenue-CAGR wind-down — which frames both the asymmetry and the price of the regulatory tail. A second CSRC action → HOLD.

2. Company overview: what UP Fintech actually does

UP Fintech Holding Limited (NASDAQ: TIGR), known as **Tiger Brokers** in Asia, was founded in 2014 by Tianhua Wu, listed on Nasdaq in March 2019, and is headquartered in Singapore. It is a technology-driven online brokerage serving global investors through its flagship **Tiger Trade** platform (mobile and desktop), plus the **TradeUP** brand in the United States. The footprint: 10m+ registered users, ~2.6m account holders, 1.32m funded accounts, \$60.7b of client assets, 81 licenses and qualifications across markets, and 1,000+ employees in Hong Kong, Singapore, New Zealand, the US, Australia and mainland China.

Revenue model. Four streams: (1) **commissions** on trading (\$78.3m in Q2 2026, +21% YoY); (2) **interest income** from margin financing and securities lending plus idle-cash balances (\$79.8m, +36% YoY) — together these two are ~87% of revenue; (3) **financing service and other fees** (IPO distribution income, ESOP services, wealth-management fees, exchange rebates); (4) small investment-banking and other income. The mix has been steadily shifting toward interest income, which is higher-margin and more recurring than transaction commissions.

Geography. Singapore and Hong Kong drove >70% of new funded accounts in Q2 2026; Australia/New Zealand and the US posted the strongest client-asset growth. Mainland-China retail assets were ~10% of the total at end-2025 and are in managed wind-down following the CSRC action — the growth story is now explicitly ex-China.

3. Product evaluation and pricing

We evaluate each product on its economics — what it charges, what it costs, and what strategic job it does:

Product	Pricing / economics	Assessment
Tiger Trade brokerage (core)	Zero commission + zero platform fee on HK equities; low fixed commissions in SG; freemium tools. Cash-equity take rate 3.6 bps in Q2 (from 5.9 bps) on zero-commission US local volume.	Loss-leader, rationally. Commission subsidy is customer-acquisition cost; payback comes via margin balances. Risk: take-rate erosion becomes permanent if mix keeps shifting.

Product	Pricing / economics	Assessment
Margin financing & securities lending	\$7.4b balance (+28.9% YoY); spread over funding cost; securities-lending fees. Drove \$79.8m Q2 interest income (+36%).	The profit engine. ~44% of revenue, highest incremental margin. Cyclical leverage to rates and volumes — the key earnings swing factor.
Self-clearing infrastructure	>90% of US cash-equity/option flow self-cleared; 'industry leading low' clearing expense.	Durable cost moat. Converts scale into a structural per-trade advantage smaller brokers cannot match.
Tiger Vault (cash management)	USD/HKD money-market funds; yield passed mostly to clients with a spread retained.	Deposit stickiness. Raises switching costs; keeps idle cash inside the ecosystem.
IPO subscription / distribution	Fees + allocations; 47 US & HK IPOs participated in 2025.	Acquisition hook. Hot-IPO access is a proven retail magnet in Asia; lumpy, cycle-dependent revenue.
ESOP management	SaaS-style fees from 840 corporate clients (+12% in Q2).	B2B2C funnel. Fee income plus employee-investors acquired at near-zero CAC.
Wealth (Fund Mall, HK Type 9 license)	Trailer/management fees; early stage.	Only recurring-fee path. Small today; the strategic answer to transaction cyclicality.
Virtual assets (YAX Exchange)	HK VATP + Type 1 license uplift for professional-investor crypto dealing.	Free option. Negligible today; regulatory lottery ticket on HK becoming Asia's compliant crypto hub.
TigerAI	Embedded AI research assistant (ex-TigerGPT): portfolio, watchlist, options analysis.	Retention tool. Differentiator today, table stakes in two years.

Net: the product suite is coherent — acquire cheaply on price, monetize on margin balances and ancillary services, retain with cash management and AI tools. The pricing strategy (zero-commission flagships) is aggressive but economically legible: lifetime value is harvested through the interest book, not the ticket charge.

4. Financial review

Q2 2026 (reported August 26, 2026): record revenue, back to profit. Total revenue of \$182.3m (+31.4% YoY, +17.7% QoQ) was an all-time high; operating income \$56.8m (+12.6% YoY); GAAP net income \$39.4m and non-GAAP \$42.8m, rebounding from the penalty-depressed Q1 loss. EPS of \$0.23 beat the \$0.21 consensus while revenue beat by ~18%. The blemish: operating costs +46.5% YoY (severance from a reorganization, +87% brand marketing in HK/SG) — growth spending that must convert into accounts.

Q2 2026 metric	Q2 2026	Q2 2025	YoY
Total revenue	\$182.3 m	\$138.7 m	+31.4%
Commission income	\$78.3 m	\$64.7 m	+20.9%
Interest-related income	\$79.8 m*	\$58.7 m	+35.1%
Operating income (margin)	\$56.8 m (31.1%)	\$50.4 m	+12.6%
GAAP / non-GAAP net income	\$39.4 m / \$42.8 m	\$41.4 m / \$44.5 m	-4.8% / -3.8%
Funded accounts	1.315 m	1.193 m	+10.3%
Client assets	\$60.7 bn	\$52.0 bn	+16.7%
Margin + sec-lending balance	\$7.4 bn	\$5.7 bn	+28.9%

*Company release cites \$79.8m interest income and \$83m interest-related income on slightly different definitions. Source: company Q2 2026 press release; YoY bases derived.

Multi-year trend: hypergrowth with scaling margins. Revenue nearly tripled from 2023 to 2025 while net margins expanded from 12% to 28%.

Year	Revenue	Net income	Net margin
2023	\$272.5 m	\$32.6 m	12.0%
2024	\$391.5 m	\$60.7 m	15.5%
2025	\$613.7 m	\$171.4 m	27.9%
H1 2026	\$337.2 m	\$12.5 m*	3.7%*
H1 2026 ex-penalty	\$337.2 m	~\$72 m	~21.4%

*GAAP H1 2026 includes the \$59.7m CSRC penalty booked in Q1. Source: company releases.

Quarter	Revenue	Net income	Note
Q1 2025	\$122.6 m	\$30.4 m	
Q2 2025	\$138.7 m	\$41.4 m	
Q3 2025	\$176.1 m	\$54.1 m	Derived from FY
Q4 2025	\$176.3 m	\$45.5 m	
Q1 2026	\$154.9 m	-\$26.9 m	\$59.7m penalty
Q2 2026	\$182.3 m	\$39.4 m	Record revenue

Quarterly revenue (navy, \$m) and GAAP net income (green, \$m). Q1 2026 is the penalty quarter; the revenue line is unbroken. Source: company releases.

Balance sheet: fortress-light. Cash and term deposits of \$544.6m at June 30, 2026 (down from \$793.1m at year-end 2025 on the penalty payment, margin-book growth and investment spend), debt-to-equity of 0.06, and a \$50m twelve-month buyback (\$5m executed by Q2). For a company with a ~\$811m market cap, the cash pile alone is ~67% of enterprise value — the operating business is being valued at roughly \$266m, or about 1.4x trailing operating earnings.

5. The CSRC penalty: what happened and why it is contained

On **May 22, 2026**, the Beijing Bureau of the China Securities Regulatory Commission imposed administrative penalties and confiscation of illegal gains totaling approximately **RMB 411m (~\$59.7m)** on certain UP Fintech subsidiaries, for **unlicensed cross-border securities business and related fund/futures activities in mainland China**. Chairman/CEO Tianhua Wu received a warning and a RMB 1.25m personal penalty. The company accepted the decision, booked it as a Q1 subsequent event, and committed to rectification.

It punishes the past, not the future. The violations relate to legacy mainland-China onboarding flows. Mainland retail client assets were ~10% of the total at end-2025 and are being wound down in an orderly, regulator-supervised process. The growth engine — Singapore, Hong Kong, ANZ, the US — is untouched.

The peer comparison is the tell. Futu was fined \$271m in the same sweep, for the same category of violations — 4.5x UP Fintech's fine — and its \$15.7b market cap treated it as a speed bump. TIGR's \$59.7m fine produced a ~60% peak-to-trough derating. Same problem, opposite market verdicts: that is narrative, not analysis.

One-off by construction. It is a fixed administrative penalty plus disgorgement, not an ongoing levy. Management states — credibly, given the cash position — that it has no material impact on operations or long-term development. Q2's immediate return to profitability supports that.

What would change our mind: a second enforcement action, criminal liability, or evidence the remediation is failing. None has emerged in the four months since.

6. Growth outlook

Consensus expects Q3 2026 revenue of ~\$177.3m and EPS of ~\$0.27, implying full-year revenue of roughly \$700m (+14% YoY). Our hardened base case models an 11% revenue CAGR through 2036 (to ~\$2.0b) — a sharp deceleration from the 43% realized in 2023–2025, reflecting a larger base and commission pressure. Drivers:

Account compounding in core markets. Singapore/Hong Kong supplied >70% of Q2's 32,600 net new funded accounts; the playbook (zero-commission flagships, IPO access, localized features like SG fractional shares) is proven and repeatable.

Margin-book expansion. \$7.4b at +29% YoY with rising client assets (\$60.7b, +17%) — every incremental dollar of client assets is optionality on spread income.

Wealth and virtual assets. Tiger Vault deepens deposit stickiness; the HK Type 9 license and YAX virtual-asset licenses open fee and crypto revenue streams that do not exist in the numbers yet.

Operating leverage. Self-clearing scale and a largely fixed technology base mean incremental accounts carry high contribution margins — visible in the 28% normalized net margin.

The bear case on growth — commission wars, take-rate erosion, and a trading-volume downturn — is real for the whole brokerage industry, not TIGR-specific. Our hardened bear scenario (–4% revenue CAGR to \$465m by 2036) captures it.

7. Moat assessment

We rate the moat **narrow**: real, but not the wide technology moat of an IBKR. Sources, in order of durability:

Regulatory licenses (81 across markets). Brokerage licenses are slow and expensive to obtain; in Singapore (MAS) and Hong Kong (SFC) they are genuine barriers. This cuts both ways — the CSRC episode shows licenses are also the attack surface.

Self-clearing scale. >90% internalization of US flow is a cost advantage that compounds with volume and cannot be replicated without similar scale.

Brand with the Chinese diaspora. 'Tiger Brokers' is the default choice for overseas Chinese investors — a demographic tailwind as wealth migrates to Singapore/Hong Kong.

One-app global access + data. Multi-market, multi-currency trading with embedded AI tooling raises switching costs modestly; account balances are sticky.

What it is *not*: a network-effects moat (brokerages have weak network effects), nor a low-cost moat at IBKR's level. The moat defends a profitable niche; it does not confer pricing power — hence the ongoing take-rate compression.

8. Competition

Rival	Arena	Threat	Read-through
Futu (FUTU)	Direct: Chinese-diaspora online brokerage	High	\$15.7b mcap, 11.1x P/E; bigger, more profitable, fined \$271m in same sweep with no derating — the valuation benchmark and the narrative foil
Interactive Brokers	Global low-cost brokerage	High	The cost-to-serve leader (34x P/E); wins on price and breadth — Tiger competes on localization, not cost
Robinhood	US retail; crypto	Medium	50x P/E growth darling; overlapping US ambitions via TradeUP
Charles Schwab	US mass-affluent	Medium	18x P/E incumbent; competes for the same HNW-adjacent flows
DBS Vickers / POEMS / local HK brokers	Singapore / Hong Kong incumbents	Medium	Bank-backed trust advantage; structurally higher cost bases Tiger undercuts

The industry structure is a secular commission-compression story: zero-commission flagships acquire, margin books monetize. Tiger's positioning — premium-localized product for Asian investors rather than bare-bones cheapest — has sustained take rates better than pure discounters, but the Q2 take-rate step-down shows the pressure is live.

9. Key risks

China regulatory tail (the #1 risk). A second CSRC action, criminal referral, or forced acceleration of the mainland wind-down would impair the thesis. This is a low-probability, high-impact tail — the reason for a High risk rating and a target below our DCF.

Commission and spread compression. Take rate fell from 5.9 to 3.6 bps in a year; a full commission war with Futu/IBKR would erode the acquisition subsidy model.

Cyclicality. ~87% of revenue is transaction- or balance-linked; a sustained volume downturn or rate cuts compress both commissions and net interest income simultaneously.

ADR / delisting overhang. As a Chinese-issuer ADR, HFCAA-related headline risk periodically compresses the multiple regardless of fundamentals.

Concentration and governance. 50.9% insider ownership means minority shareholders ride the founder's decisions; institutional ownership of 9% leaves the stock thinly covered (6–7 analysts).

Execution on costs. Opex +46.5% YoY must convert into durable account growth; sustained cost growth without operating leverage would reset margins lower.

10. Valuation: four lenses, one answer

Lens 1 — hardened scenario DCF (primary). Net-income-based model (brokerages distribute most earnings; retention haircut of 20% bear / 12% base / 10% bull for margin-book capital), FY26E revenue anchor ~\$700m, 10-year explicit period to 2036, plus adjusted net cash of \$291m (\$1.59/ADS, 60% of reported cash less debt for regulatory capital). Scenario-specific costs of equity — **14.5% bear / 12% base / 10.5% bull** — to reflect the regulatory risk premium.

Scenario	Revenue CAGR to 2036	Cost of equity	Implied price	Weight
Bear — wind-down: rev shrinks to \$465m; 50% terminal derating	-4.0%	14.5%	\$3.70	25%

Scenario	Revenue CAGR to 2036	Cost of equity	Implied price	Weight
Base	+11.0% — penalty absorbed, growth to \$1,988m	12.0%	\$15.73	50%
Bull	+16.0% — re-rating, wealth/VA options land	10.5%	\$29.26	25%
Weighted	25 / 50 / 25		\$16.11	

Lens 2 — peer multiples. On TTM non-GAAP EPS of ~\$0.98, TIGR trades at 4.2x — the cheapest broker in the peer set by a wide margin, with the discount entirely attributable to the China-regulatory narrative rather than growth or margins.

Company	TTM P/E	Market cap	Comment
UP Fintech (TIGR)	~4.2x	\$0.8 bn	Cheapest in group; penalty narrative discount
Futu (FUTU)	11.1x	\$15.7 bn	Closest comp; same penalty, no derating
Charles Schwab	17.8x	\$169 bn	US incumbent
Interactive Brokers	34.0x	\$145 bn	Cost leader; quality premium
Robinhood	49.6x	\$101 bn	Growth premium

Multiples as of Sep 30, 2026 (Finnhub; company filings). FUTU-parity 11x on TIGR's ~\$0.98 normalized EPS implies **\$10.74**; an 8x China-discount multiple implies \$7.81; a 5x distress multiple implies \$4.88 — essentially today's price.

Lens 3 — reverse DCF. Backing the \$4.16 price into the model (base-case margins and discount rate) implies a **mid-20s five-year revenue decline** — the market expects the business to shrink by roughly a quarter, versus +43% actually realized from 2023—2025. The embedded pessimism is arithmetically extreme and is the core of the long thesis.

Lens 4 — street. Consensus ~\$8.16, Moderate Buy (MarketBeat: 4 Buy, 2 Hold, 1 Sell across 7 analysts; Citi \$7.10 Buy, Jefferies \$7.70 Buy). The street is constructive but anchored to the penalty headline; our hardened DCF (\$16.11) sits roughly double consensus — the gap is the regulatory narrative, not the arithmetic.

Target: our hardened 10-year DCF-weighted \$16.11 sets the **\$16.00** 12-month target (+285%). The bear case (\$3.70) now sits below the \$4.16 price and prices a genuine wind-down (–4% revenue CAGR, 50% terminal derating) — that is the honest price of the regulatory tail risk, and it is why this remains a High-risk, starter-sized position rather than a core holding.

11. Recommendation

We rate UP Fintech **BUY** with a **\$16.00** 12-month price target (+285% upside), **High risk**. The thesis in one line: a 30%-grower with ~28% normalized margins and a net-cash balance sheet is trading at 4.2x earnings because the market priced a one-off, backward-looking fine as an existential event — while its larger peer absorbed a 4.5x bigger fine in the same sweep without a scratch.

What gets us there (catalysts): Q3 earnings on Dec 2, 2026 confirming the growth trajectory; formal closure of the CSRC remediation; continued buyback execution (\$45m remaining); Singapore/Hong Kong account momentum; any re-rating toward the Futu multiple — which alone doubles the stock.

What breaks the thesis: a second CSRC enforcement action or criminal liability — **that single event moves us to HOLD**; commission caps spreading or a full commission war; a disorderly volume/rate downturn hitting commissions and net interest income together. Any of these pushes fair value toward our \$3.70 bear case — which is why this is a starter-sized, high-risk position, not a core holding.

Positioning: for investors who can underwrite EM regulatory headline risk, TIGR offers deep-value upside (\$29.26 bull case, +603%) with a profitable, cash-generative core and a \$545m cash cushion limiting the downside. Initiate at current levels; add on evidence the CSRC remediation is formally closed or that the stock re-rates toward peer multiples on clean quarters.

Appendix: sources and verification notes

Company: Q2 2026 press release and earnings-call transcript summary (Aug 26, 2026); Q1 2026 press release and 6-K exhibit 99.1 (Jun 2, 2026 — CSRC penalty disclosure); 20-F annual report. Market data as of October 2, 2026 close (Finnhub; Digrin; FXEmpire; StockTitan). Peer multiples: Finnhub (FUTU P/E 11.1x, \$15.7b mcap), financecharts/barchart cross-checks. Analyst consensus: MarketBeat (\$8.16 avg, 7 analysts), Barchart, TipRanks, Stockopedia; individual notes: Citigroup (Buy, \$7.10, Jun 3 2026), Jefferies (Buy, \$7.70, Aug 27 2026), BofA (Buy, Jun 1 2026), Weiss (Hold, Aug 31 2026). Product/license details: company releases via GlobeNewswire/StockTitan; Euromoney Awards 2026 (Tiger Brokers Singapore).

Estimates and derivations flagged: FY26E revenue ~\$700m and TTM non-GAAP net income ~\$190m are analyst-derived from company releases; ADS count ~195m derived from market cap and price; adjusted net cash (\$291m) applies a 60% regulatory-capital haircut to reported cash less estimated debt; Q3 2025 figures derived from full-year 2025 less reported quarters. DCF assumptions (growth, margins, cost of equity, terminal growth) are analyst judgments — see the scenario table. This analysis was prepared October 4, 2026 for informational purposes only and is not investment advice; all forward-looking statements involve risk and uncertainty.
